

NAME OF SCHOOL: MATER MISERICORDIAE SECONDARY SCHOOL,
RUMOMASI

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: ONE

CLASS: SS1

SUBJECT: Home Management

TOPIC: Introduction to Food & Nutrition

Introduction

- Food is any substance eaten or drunk which nourishes the body and keeps it healthy. Nutrition is the study of food, the nutrients in it, and how the body uses them.

Importance of food

- Supplies energy for work and growth; builds and repairs body cells; protects the body against disease; regulates body processes; maintains body warmth; prevents malnutrition; provides enjoyment and social bonding.

Classification of food

- By origin — plant foods (cereals, fruits, vegetables) and animal foods (meat, fish, eggs, milk).
- By function — energy-giving foods (carbohydrates and fats), body-building foods (proteins), protective foods (vitamins and minerals).
- By chemical composition — carbohydrates, proteins, fats and oils, vitamins, minerals, water. The food we eat must be a balanced combination of all.

Terms in nutrition

- **Nutrient** — a substance in food needed by the body; **diet** — food a person habitually eats; **balanced diet** — a diet containing all nutrients in the right proportions; **malnutrition** — state of poor health caused by eating too little, too much or the wrong foods; **digestion** — the breakdown of food into absorbable forms.

CLASS EVALUATION

1. Define food and nutrition.
2. Classify foods by function with examples.
3. What is a balanced diet?
4. State four importance of food to the body.

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: TWO

CLASS: SS1

SUBJECT: Home Management

TOPIC: Nutrients & Their Functions

Introduction

- The six classes of nutrients are carbohydrates, proteins, fats and oils, vitamins, minerals and water. Each has specific functions; shortage causes deficiency diseases.

The energy and body-building nutrients

- **Carbohydrates** — sugars and starches (rice, yam, bread, maize): supply energy; excess is stored as fat. Deficiency: weakness, weight loss, ketosis.
- **Proteins** — animal (meat, fish, egg, milk) and plant (beans, soya, groundnut): growth and repair; deficiency: kwashiorkor, stunted growth.
- **Fats and oils** — butter, palm oil, groundnut oil: energy store, insulation, transport of fat-soluble vitamins; excess leads to obesity and heart disease.

Protective nutrients

- **Vitamins** — A (eyes, skin; deficiency: night blindness), B-complex (nerves; beriberi), C (gums, healing; scurvy), D (bones; rickets), K (blood clotting). Vitamins are fat-soluble (A, D, E, K) or water-soluble (B, C).
- **Minerals** — calcium (bones, teeth), iron (blood; deficiency: anaemia), iodine (thyroid; goitre), sodium and potassium (body fluids), phosphorus (bones).
- **Water** — 60–70% of the body: transport, temperature regulation, digestion, excretion.

CLASS EVALUATION

1. List the six classes of nutrients.
2. Which nutrient prevents kwashiorkor and how?
3. State the deficiency disease of vitamin C, iron and iodine.
4. Why is water called the most important nutrient?

RUMOMASI**

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: THREE

CLASS: SS1

SUBJECT: Home Management

TOPIC: Food Groups & My Plate

Introduction

- Foods are grouped to make meal planning easy. The traditional food groups are: energy foods, body-building foods, protective foods and energy-storage foods; the modern approach is 'My Plate' — a simple visual guide to a balanced meal.

The three food groups / tips

- **Group 1: energy foods** — cereals, tubers, sugars and fats (eat most).
- **Group 2: body-building foods** — meat, fish, eggs, milk, beans (eat moderately).
- **Group 3: protective foods** — fruits, vegetables (eat plenty).
- Water should accompany every meal; exercise daily; limit salt, sugar and saturated fat.

My Plate

- Fill half the plate with vegetables and fruits, a quarter with protein (beans, fish, meat) and a quarter with carbohydrates (rice, yam, garri); add a serving of dairy and a little oil. My Plate replaces guesswork with proportion and is adaptable to local foods (the Nigerian plate: pounded yam + egusi + vegetables).

Meal planning

- Plan meals around the family's needs, budget and culture; use the food groups; vary the menu; consider the age and activity of each family member; buy in season; prepare hygienically.

CLASS EVALUATION

1. Name the three food groups with examples.
2. Describe the composition of My Plate.
3. Plan a balanced dinner for a family of four on a moderate budget.
4. Why do athletes need more carbohydrate?

RUMOMASI**

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: FOUR

CLASS: SS1

SUBJECT: Home Management

TOPIC: Food & Health

Introduction

- Health is a state of complete physical, mental and social well-being, not merely the absence of disease. Nutrition is a major determinant of health: the food we eat either protects us or harms us.

Diet-related diseases

- **Malnutrition** — kwashiorkor (protein deficiency: swollen belly, poor growth), marasmus (total energy deficiency: wasting), rickets (vitamin D), anaemia (iron), goitre (iodine), blindness (vitamin A).
- **Obesity** — excess energy intake; linked to diabetes and heart disease. **Diabetes, hypertension, coronary heart disease, dental caries, constipation** — all related to diet.

Food-related health practices

- Eat a balanced diet; wash hands before handling food; drink safe, boiled water; avoid excessive salt, sugar and fat; eat fibre for a healthy gut; attend clinics and immunisation; keep the kitchen and utensils clean; store food properly (cover, refrigerate, avoid contamination by insects) — food hygiene prevents typhoid, cholera and food poisoning.

CLASS EVALUATION

1. Define health.
2. Differentiate between kwashiorkor and marasmus.
3. How does diet cause hypertension?
4. List four rules of food hygiene.

RUMOMASI**

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: FIVE

CLASS: SS1

SUBJECT: Home Management

TOPIC: Kitchen Equipment & Utensils

Introduction

- Kitchen equipment is the tools and machines used to prepare, cook, serve and store food. They are classified into large equipment, small equipment, and utensils.

Classification with examples

- **Large equipment** — cookers (gas, electric), refrigerators and freezers, ovens, sinks, work tables, cupboards, blenders, microwave ovens.
- **Small equipment/utensils** — pots and pans (saucepans, frying pans), knives (chopping, paring), wooden spoons, ladles, turners/ spatulas, sieves, graters, measuring cups and spoons, chopping boards, cutlery (forks, knives, spoons), plates, cups and glasses, basins, kettles, pressure cooker.

Materials and care

- Utensils are made of aluminium, stainless steel, cast iron, glass, ceramic, plastic and wood. Stainless steel is durable and easy to clean; aluminium conducts heat but scratches; cast iron holds heat; plastic is light but not for hot food.
- Care: wash immediately after use; dry and store in a clean, dry cupboard away from pests; sharpen knives; avoid scratching non-stick surfaces; check for rust and replaced worn parts.

Choosing equipment

- Consider the size of the family, cost, material quality, durability, safety, ease of cleaning and storage space.

CLASS EVALUATION

1. Classify kitchen equipment into large and small, with three examples each.
2. State two advantages of stainless steel utensils.
3. How do you care for knives?
4. Mention two factors to consider when buying a cooking pot.

RUMOMASI**

TERM: FIRST 2026/2027 ACADEMIC SESSION

WEEK: SIX

CLASS: SS1

SUBJECT: Home Management

TOPIC: Food Hygiene & Safety

Introduction

- Food hygiene is the set of practices that keeps food safe from contamination — microbiological, chemical and physical. It protects the family from food-borne diseases.

Sources of contamination

- **Biological** — bacteria, viruses, moulds, parasites (flies, cockroaches, rats) and their faeces.
- **Chemical** — insecticides, detergents, pesticides on vegetables, additives.
- **Physical** — stones, hair, broken glass, insects.
- Contamination occurs through dirty hands, unclean utensils, uncovered food, unwashed vegetables, stale food, unsafe water and improper storage.

Rules of food hygiene

- Wash hands with soap before and during cooking; wash all raw foods (fruits, vegetables) thoroughly; cook food thoroughly and reheat properly; keep raw and cooked food separate; cover food; store perishables in the refrigerator; keep the kitchen clean; throw away food past its 'use by' date; protect food from pests; ensure safe water; keep food at safe temperatures (below 5 °C or above 60 °C).

Food-borne diseases

- Typhoid, cholera, dysentery, diarrhoea, food poisoning, gastroenteritis, hepatitis A. Symptoms include stomach pain, vomiting, diarrhoea and fever. Prevention is always cheaper than treatment.

CLASS EVALUATION

1. Define food hygiene.
2. List three sources of food contamination.
3. State five rules of food hygiene.
4. Name two diseases caused by contaminated food.
